## Collaboration Statement

I worked on this homework independently. No outside collaborators or resources were used, except for the textbook *Elementary Analysis: The Theory of Calculus* by Ross and my own class notes.

## Problem 1

Prove if  $x$  and  $y$  are real numbers, then:

A.  $|x - y| \leq |x| + |y|$

B.  $|x| - |y| \leq |x - y|$

**Proof.**

A. We want to prove  $|x - y| \leq |x| + |y|$ .

First write the difference as a sum:

$$x - y = x + (-y).$$

By the triangle inequality applied to the numbers  $x$  and  $-y$ ,

$$|x - y| = |x + (-y)| \leq |x| + |-y| = |x| + |y|.$$

Thus  $|x - y| \leq |x| + |y|$ , as required.

B. We want to prove  $|x| - |y| \leq |x - y|$ .

Start with the triangle inequality for the sum  $(x - y) + y$ :

$$|(x - y) + y| \leq |x - y| + |y|.$$

The left-hand side simplifies to  $|x|$ , so

$$|x| \leq |x - y| + |y|.$$

Subtract  $|y|$  from both sides (this is valid because  $|y|$  is a real number):

$$|x| - |y| \leq |x - y|.$$

Hence  $|x| - |y| \leq |x - y|$ , as desired.

□

## Problem 2 (Ross Chapter 1, 3.6)

- a. Prove  $|a + b + c| \leq |a| + |b| + |c|$  for all  $a, b, c \in \mathbb{R}$ .

*Hint:* Apply the triangle inequality twice. Do not consider eight cases.

*Proof.* By associativity of addition,

$$|a + b + c| = |(a + b) + c|.$$

Applying the triangle inequality  $|u + v| \leq |u| + |v|$  with  $u = a + b$  and  $v = c$  gives

$$|(a + b) + c| \leq |a + b| + |c|.$$

Apply the triangle inequality again to  $|a + b|$ :

$$|a + b| \leq |a| + |b|.$$

Substituting this into the previous inequality yields

$$|a + b + c| \leq (|a| + |b|) + |c| = |a| + |b| + |c|,$$

as required.

□

- b. Use induction to prove that for  $n$  real numbers  $a_1, \dots, a_n$ ,

$$|a_1 + a_2 + \dots + a_n| \leq |a_1| + |a_2| + \dots + |a_n|.$$

*Proof.* Let  $P(n)$  denote the statement

$$|a_1 + \dots + a_n| \leq |a_1| + \dots + |a_n| \quad \text{for all real } a_1, \dots, a_n.$$

**Base case.** For  $n = 1$ ,  $|a_1| \leq |a_1|$  is trivial. (If you prefer to start at  $n = 2$ , then  $|a_1 + a_2| \leq |a_1| + |a_2|$  is exactly the triangle inequality.)

**Inductive step.** Assume  $P(n)$  holds for some  $n \geq 1$ ; i.e.,

$$|a_1 + \dots + a_n| \leq |a_1| + \dots + |a_n| \quad \text{for all } a_1, \dots, a_n \in \mathbb{R}.$$

Let  $a_1, \dots, a_n, a_{n+1} \in \mathbb{R}$  be arbitrary. Using associativity and the triangle inequality,

$$\begin{aligned} |a_1 + \dots + a_n + a_{n+1}| &= |(a_1 + \dots + a_n) + a_{n+1}| \\ &\leq |a_1 + \dots + a_n| + |a_{n+1}|. \end{aligned}$$

By the inductive hypothesis,

$$|a_1 + \dots + a_n| \leq |a_1| + \dots + |a_n|.$$

Combining the two inequalities gives

$$|a_1 + \dots + a_n + a_{n+1}| \leq (|a_1| + \dots + |a_n|) + |a_{n+1}| = |a_1| + \dots + |a_n| + |a_{n+1}|.$$

Thus  $P(n+1)$  holds.

By the principle of mathematical induction,  $P(n)$  is true for every  $n \in \mathbb{N}$ . □

### Problem 3 (Ross Chapter 1, 3.8)

Let  $a, b \in \mathbb{R}$ . Show: if  $a \leq b_1$  for every  $b_1 > b$ , then  $a \leq b$ .

*Proof.* We prove the contrapositive. Suppose  $a > b$ . Define

$$b_1 = \frac{a+b}{2}.$$

Since  $a > b$ , we have  $a - b > 0$ , hence  $\frac{a-b}{2} > 0$ . Adding  $b$  to both sides gives

$$b + \frac{a-b}{2} = \frac{a+b}{2} = b_1 > b.$$

Also, from  $a - b > 0$  we get  $a - \frac{a-b}{2} = \frac{a+b}{2} = b_1 < a$ . Therefore  $b_1 > b$  and  $a \not\leq b_1$ .

Thus, if  $a > b$  there exists  $b_1 > b$  for which  $a \not\leq b_1$ . This is the contrapositive of the desired implication, and hence the original statement holds: if  $a \leq b_1$  for every  $b_1 > b$ , then  $a \leq b$ . □

### Problem 4

**Definition.** An integer  $n$  is divisible by an integer  $d$  if  $n = dk$  for some  $k \in \mathbb{Z}$ .

**Theorem.** Suppose  $n$  is an integer. If  $n^2$  is divisible by 3, then  $n$  is divisible by 3.

*Proof.* We proceed by proving the contrapositive: If  $n$  is not divisible by 3, then  $n^2$  is not divisible by 3.

If  $n$  is not divisible by 3, then by the Division Algorithm we can write

$$n = 3k + 1 \quad \text{or} \quad n = 3k + 2$$

for some integer  $k$ .

**Case 1.** If  $n = 3k + 1$ , then

$$n^2 = (3k + 1)^2 = 9k^2 + 6k + 1 = 3(3k^2 + 2k) + 1.$$

Thus  $n^2 \equiv 1 \pmod{3}$ , so  $n^2$  is not divisible by 3.

**Case 2.** If  $n = 3k + 2$ , then

$$n^2 = (3k + 2)^2 = 9k^2 + 12k + 4 = 3(3k^2 + 4k + 1) + 1.$$

Again,  $n^2 \equiv 1 \pmod{3}$ , so  $n^2$  is not divisible by 3.

In both cases, if  $n$  is not divisible by 3, then  $n^2$  is not divisible by 3. By contrapositive, if  $n^2$  is divisible by 3, then  $n$  must be divisible by 3.  $\square$

## Problem 5

Prove that  $\sqrt{3}$  is irrational.

*Proof.* Suppose, toward a contradiction, that  $\sqrt{3}$  is rational. Then there exist integers  $p, q$  with  $q \neq 0$  such that

$$\sqrt{3} = \frac{p}{q} \quad \text{and} \quad \gcd(p, q) = 1$$

(i.e., the fraction is in lowest terms). Squaring both sides yields

$$3 = \frac{p^2}{q^2} \implies p^2 = 3q^2.$$

Hence  $p^2$  is divisible by 3. By the result of Problem 4 (if  $n^2$  is divisible by 3, then  $n$  is divisible by 3), it follows that  $3 \mid p$ . Thus there exists  $k \in \mathbb{Z}$  with  $p = 3k$ . Substituting back, we obtain

$$3q^2 = p^2 = (3k)^2 = 9k^2 \implies q^2 = 3k^2,$$

so  $3 \mid q$  as well.

Therefore  $p$  and  $q$  are both divisible by 3, which contradicts  $\gcd(p, q) = 1$ . This contradiction shows our initial assumption was false. Hence  $\sqrt{3}$  is irrational.  $\square$

## Problem 6

Prove that  $\sqrt{2} + \sqrt{3}$  and  $\sqrt{2} - \sqrt{3}$  are both irrational numbers.

*Proof.* **(1)  $\sqrt{2} + \sqrt{3}$  is irrational.** Suppose, for a contradiction, that  $r = \sqrt{2} + \sqrt{3} \in \mathbb{Q}$ . Then  $\sqrt{3} = r - \sqrt{2}$  and squaring gives

$$3 = (r - \sqrt{2})^2 = r^2 - 2r\sqrt{2} + 2.$$

Rearranging yields

$$-2r\sqrt{2} = 1 - r^2 \implies \sqrt{2} = \frac{r^2 - 1}{2r}.$$

Since  $r \in \mathbb{Q}$ , the right-hand side is rational, which implies  $\sqrt{2} \in \mathbb{Q}$ , a contradiction. Hence  $\sqrt{2} + \sqrt{3}$  is irrational.

**(2)  $\sqrt{2} - \sqrt{3}$  is irrational.** Observe that

$$(\sqrt{2} + \sqrt{3})(\sqrt{2} - \sqrt{3}) = 2 - 3 = -1.$$

If  $\sqrt{2} - \sqrt{3}$  were rational, then  $\sqrt{2} + \sqrt{3} = -1/(\sqrt{2} - \sqrt{3})$  would be rational, contradicting part (1). Therefore  $\sqrt{2} - \sqrt{3}$  is irrational.  $\square$
